

A key challenge to the wide-scale implementation of photovoltaic solar panels (PV) in cold and remote areas is dealing with the effects of snow and ice buildup on the panel ...

A PV system is composed of several PV modules connected in parallel or in a series, and the performance degradation and failure or connection problem of the modules ...

Let's face it - solar panels are supposed to be the good guys in our energy story. But what happens when these clean energy champions start pushing electricity in reverse?

There is a possibility of the current flowing from the battery to the solar panel, thereby discharging the battery overnight. To prevent this from happening, a blocking diode is installed.

Blocking diodes are basically used in solar photovoltaic arrays when there are two or more parallel branches, or there is a possibility that some of the array will become partially shaded ...

In a residential solar array, bypass diodes are used when panels are in series to prevent a shaded panel from effectively becoming a large resistor. Blocking diodes prevent current from going back into a ...

As we here at Alencon tend to get involved in both of these applications quite a bit, we thought we would summarize our experience in avoiding the back feeding of power into PV panels.

One crucial concern is backflow, also known as reverse current. This article will explain what backflow is, why it's a problem, and how to prevent it, ensuring the longevity and safety of your ...

There are a variety of strategies in place to effectively control backflow and ensure the smooth and secure operation of renewable energy systems when connected to the power grid.

When your solar panels generate more power than your facility can use, that excess electricity wants to flow somewhere. But here's the kicker: it might try to push backwards into the grid.
