

The zinc-copper cell delivers a highly reversible capacity of 395 mAh g<sup>-1</sup> with nearly 100% coulombic efficiency, affording a high energy density of 380 Wh kg<sup>-1</sup> based on the copper chloride...

The classic Daniell cell was redesigned to make it rechargeable using gel electrolytes, surface coatings, and ion exchange membranes. The proposed cell chemistry is sustainable, straight-forward to ...

Constructing rechargeable zinc-copper cells has been a point of focus in many research initiatives due to its high capacity, simple synthesis method, environmental friendliness, and low cost. ...

In this report, we combine the advantages of the Zn-Cu redox and the glamorous chloride anion shuttle to develop a rechargeable historic Daniell cell.

We fabricated our own test cell in order to proof the concept of a rechargeable Zn/Cu battery. The device consisted of two identical components that were fabricated using a 3-D printer ...

First, we propose new approaches to stabilise Zn and Cu plating and stripping processes and create a rechargeable cell. Second, we replace salt bridges with an anion exchange membrane, ...

AEM Zn-Cu cells, including higher CE and better cycling stability (fig. S27). The specific capacity of the Cu metal cathode was verified based on a pre-defined amount of Cu stripped, at a current density

AEM Zn-Cu pouch cell was assembled by replacing the Cu metal cathode with CP. This configuration exhibited a stable cycling performance and reached a high average CE of 98.4% over 120 cyc

The Zn-Cu battery (Daniell cell) is one of the earliest non-rechargeable batteries. Because the electrodes are immersed in different electrolytes, an ion-conductive separator is required to ...
