

In the approach presented here, we are working on different technologies to achieve structured glass surfaces that facilitate optical reflection and transmission engineering in a solar PV module.

In hot conditions or for building with high internal loads, solar control glass is used to minimise solar heat gain. It allows sunlight to pass through a window or facade while radiating and reflecting away a large degree of the ...

It is found that the hexagonal array structured surface exhibits the highest transmission gain and anti-glare effect. The optimized hexagonal array structured surface could improve the average transmission ...

Glass is very important building material that has a unique properties that allows sunlight to enter the building, no other traditional building material can do.

In this work were present the results of the analysis of a special solar glasses transmissivity coefficient used as protective cover of photovoltaic cell. Antireflective glass due to its unique physical properties eliminate ...

For glass-based solar mirrors, a low-iron-content glass is typically employed in order to minimize optical absorption of light being transmitted through the substrate.

The sol-gel-derived AR silica coating, known for its exceptional hydrophilicity and mechanical durability, is now dominantly used in PV glass production, and is capable of enhancing light transmission by ...

These materials also offer a wide variety of performance levels for solar control, transparency, light transmittance and light reflectance, amongst others. The phenomenon in which light is reflected off exterior cladding ...

Glass-glass encapsulation, low-iron tempered glass, and anti-reflective coatings improve light management, durability, and efficiency. Advances in glass compositions, including...

These custom glass substrates optimize light transmittance, modulate refractive index, and improve spectral response, thus contributing to the enhanced performance of thin-film photovoltaic devices ...
