Battery Module: If we compare a battery pack to a human body, then the module is the "heart," responsible for storing and releasing electrical energy.

Overview Safety Construction Operating characteristics Market development and deployment Most of the BESS systems are composed of securely sealed battery packs, which are electronically monitored and replaced once their performance falls below a given threshold. Batteries suffer from cycle ageing, or deterioration caused by charge-discharge cycles. This deterioration is generally higher at high charging rates and higher depth of discharge. This aging causes a loss of performance (capacity or voltage decrease), overheating, and may eventually lead to critical failure (electrolyte leaks, fire, explo...
